Village of Lithopolis  
Drinking Water Consumer Confidence Report for 2015

Introduction
The Village of Lithopolis has prepared the following report to provide information to you, the consumer, on the quality of our drinking water. Included with this report is general health information, water quality test results, information regarding how to participate in decisions concerning your drinking water, and water system contacts.

In 2015 the Village water system was expanded by the addition of water mains serving approximately forty new lots in the Rolling Acres subdivision and twenty-four lots in Wagnall’s Run. In addition, the 12” main was extended to complete the Columbus Street main and new service taps from Elder Road to Cemetery Road.

Source Water Information
The Village of Lithopolis receives its drinking water from three wells. The wells are located at the water plant at 5664 Elder Road. The Village also has an emergency connection to the Canal Winchester water system. In 2015 Lithopolis supplied emergency water to Canal Winchester on one occasion. To date, Lithopolis has not received emergency water from Canal Winchester.

In 2002 Ohio EPA completed a study of the Village of Lithopolis’ source of drinking water to identify potential contaminant sources and provide guidance on protecting the drinking water source. According to this study, the aquifer (water-rich zone) that supplies water to the Village has a high susceptibility to contamination. This determination is based on the following:

1. The presence of a relatively thin protective layer of clay overlying the aquifer;
2. The shallow depth (less than 15 feet below ground surface) of the aquifer;
3. The presence of significant potential contaminant sources in the protection area.

There is currently no evidence to suggest that the Village’s ground water has been impacted by any significant levels of chemical contaminants from human activities.

However, this susceptibility means that under currently existing conditions, the likelihood of the aquifer becoming contaminated is relatively high. OEPA has determined that this likelihood can be minimized by implementing appropriate protective measures. To minimize this risk, the Village of Lithopolis continues to participate in the Fairfield County Regional Drinking Water Source Protection Plan and has passed a Well Head Protection Ordinance which places restrictions on activities within the area of the production wells. More information about the source water assessment, the Fairfield County Regional Drinking Water Source Protection Plan, or what consumers can do to help protect the aquifer is available by calling the Village office, or by contacting the Ohio EPA at 614-644-2752 or by accessing Ohio EPA’s Source Water Protection Web page at [http://www.epa.state.oh.us/ddagw/pdu/swap.html](http://www.epa.state.oh.us/ddagw/pdu/swap.html).

What are sources of contamination to drinking water?
The sources of drinking water, both tap and bottled water, include rivers, lakes, streams, ponds, reservoirs, springs and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity.

Contaminants that may be present in sources of water include:

(A) MICROBIAL CONTAMINANTS, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations and wildlife;

(B) INORGANIC CONTAMINANTS, such as salts and metals, which can be naturally-occurring or result from urban storm water runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming;

(C) PECTICIDES AND HERBICIDES, which may come from a variety of sources such as agriculture, urban storm runoff and residential uses;

(D) ORGANIC CHEMICAL CONTAMINANTS, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations, urban storm runoff and septic systems;
RADIOACTIVE CONTAMINANTS, which can be naturally-occurring or be the result of oil and gas production and mining actives.

In order to ensure that tap water is safe to drink, USEPA prescribes regulations which limit the amount of certain contaminants in water provided by public water systems. In addition, FDA regulations establish limits for contaminants in bottled water which also must provide the same protection for public health. Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency’s Safe Drinking Water Hotline (1-800-426-4791).

**Lead Education Information**

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. The Village of Lithopolis is responsible for providing high quality drinking water, but cannot control the variety of materials used in residential plumbing components. The Village of Lithopolis has no identified lead service lines or main lines. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at [http://www.epa.gov/safewater/lead](http://www.epa.gov/safewater/lead).

**Who needs to take special precautions?**

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as people with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk for infections. These people should seek advice about drinking water from their health care provider. EPA/CDC guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from the Safe Drinking Water Hotline (1-800-426-4791).

**About your drinking water**

The EPA requires regular sampling to ensure drinking water safety. The Village of Lithopolis conducted sampling for bacteria, iron, hardness, manganese, sodium, nitrate, and nitrite, chloride, Trihalomethanes, and Haloacetic acids during 2015. In the past two years, forty-eight samples have been collected for bacterial contamination (all negative), as well as a total of 50 other contaminants, most of which were not detected in the Village’s water supply.

**Monitoring & Reporting Violations & Enforcement Actions**

During 2015, the Village filed the required Monthly Operating Reports for the months of August, November, and December after the deadline established by EPA. The Village also failed to respond to the EPA’s site survey letter within the prescribed 30 days. Although the 2014 CCR was mailed by July 1, 2015, EPA did not receive the required “Certification That The CCR Was Distributed” by that deadline. These violations were corrected in each instance when the required documents were filed.

**Water Quality Monitoring Information-Table of Detected Contaminants**

The Ohio EPA requires the Village to monitor for some contaminants less than once per year because the concentrations of these contaminants do not change frequently. All of our data remains accurate, though some of it is more than one year old.

Listed below is information on those contaminants that were detected in the Village of Lithopolis’ drinking water in the last five years.

**License to Operate (LTO) Information**

In 2015 the Village of Lithopolis had an unconditioned license from Ohio EPA to operate our water system.

**How do I participate in decisions concerning my drinking water?**

Public participation and comment are encouraged at regular meetings of the Lithopolis Village Council which meets the second and fourth Tuesday of each month at 7:30 o’clock P.M. in the Municipal Building, located at 11820 Lithopolis Road.

You may also call the Village Office at 614-837-2031 and speak with Ed VanVickle, the Village Administrator and Water Operator.

**Definitions of some terms contained within this report.**

**Maximum Contaminant Level Goal (MCLG):** The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

**Maximum Contaminant level (MCL):** The highest level of contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.

**Parts per Million (ppm) or Milligrams per Liter (mg/L) are units of measure for concentration of a contaminant. A part per million corresponds to one second in a little over 11.5 days.**

**Parts per Billion (ppb) or Micrograms per Liter (μg/L) are units of measure for concentration of a contaminant. A part per billion corresponds to one second in 31.7 years.**

**Maximum Residual Disinfectant Level Goal (MRDLG):** The level of drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

**Maximum Residual Disinfectant Level (MRDL):** The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

**Action Level (AL):** The concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow.

**The “<” symbol:** A symbol which means less than. **A result of <5 means that the lowest level that could be detected was 5 and the contaminant in that sample was not detected.**
